TSD File #20110056

Enclosed are the results of the EQ-Footing 10 sample received by our laboratory on November 23, 2020. This sample was tested as received. The ASTM F2107-08 *Standard Guide for Construction and Maintenance of Skinned Areas on Baseball and Softball Fields* guidelines and the Hummel Ballfield guidelines are included in the report for comparison purposes.

Particle size test results indicate that the sample is classified as sand according to the USDA soil classification system. The sand content is higher than the ASTM F2107 and Hummel ballfield guidelines.

ASTM F2107 states: "If the performance of a skinned infield mix is not totally satisfactory after installation, its physical composition can be altered by incorporating sand or amendments to loosen it or by adding clayey soil to create a firmer mix. Such alterations may be related to player preference or to ease of maintenance."

If you have any questions or need further assistance, please contact us. Samples are generally kept on the premises for 45 days after report date. Thank you for using Turf & Soil Diagnostics, Inc.
